

# Site Audit & Remediation Report

disruptorsmedia.com — work completed on the **camillo** branch · measured against the prerendered production build

|                    |                |               |                     |
|--------------------|----------------|---------------|---------------------|
| ROUTES PRERENDERED | LIGHTHOUSE SEO | ACCESSIBILITY | GEO ON-PAGE SIGNALS |
| 22 / 22            | 100            | 100           | 7 / 7               |

The root cause behind both the performance and AI-citation failures was that the site was a client-rendered SPA serving an empty HTML shell to every crawler. That is now fixed: every indexable route ships real content, headings, metadata, and structured data in the raw HTML. On-page SEO and GEO are comprehensive; the remaining gains are primarily deployment and off-page.

## What Changed — Before vs After

The plain-English summary of what improved.

| AREA                                 | BEFORE                                                                            | AFTER                                                                              |
|--------------------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| What Google & AI crawlers saw        | ✗ A blank page — content only appeared after scripts ran, so crawlers got nothing | ✓ Every page's real content, headings & info, right in the raw HTML (all 22 pages) |
| Page titles & descriptions           | ✗ One generic title/description for the entire site                               | ✓ A unique, optimized title & description on each of the 22 pages                  |
| "Rich" data for search & AI (schema) | ✗ Basic business info only                                                        | ✓ Full set: FAQs, services, how-to steps, reviews, breadcrumbs, author             |
| FAQ section                          | ✗ A "Coming soon" placeholder                                                     | ✓ Real FAQs on the home, FAQ, and all 9 service pages                              |
| Page headings                        | ✗ Missing, duplicated, or faked with styled text                                  | ✓ Exactly one proper headline per page, in correct order                           |
| AI-readiness checklist (GEO)         | ✗ 3 of 7 checks passing (score 43)                                                | ✓ 7 of 7 checks passing                                                            |
| Opening the site                     | ✗ A 1.7-second "loading..." splash screen every time                              | ✓ Content appears instantly — no splash screen                                     |
| Accessibility score                  | ✗ Failing several checks                                                          | ✓ 100 / 100                                                                        |
| Returning visitors                   | ✗ Could get stuck on a stale, cached old version forever                          | ✓ Always get the latest version                                                    |
| Homepage weight                      | ✗ ~38 MB of auto-playing video                                                    | ✓ Video skipped on phones, lazy-loaded elsewhere, images optimized                 |

## Current State (measured)

| CHECK                                   | RESULT                                        |
|-----------------------------------------|-----------------------------------------------|
| Routes shipping real HTML (prerendered) | 22 / 22                                       |
| Unique title per route                  | 22 / 22                                       |
| Titles ≤ 60 / descriptions ≤ 160 chars  | pass (home title 61 — canonical brand phrase) |

| CHECK                                           | RESULT                                         |
|-------------------------------------------------|------------------------------------------------|
| Exactly one H1 per route                        | 22 / 22                                        |
| Self-referencing canonical per route            | 22 / 22                                        |
| Lighthouse SEO / Accessibility / Best-Practices | 100 / 100 / 96                                 |
| GEO on-page signals (Content Agent heuristics)  | 7 / 7 (was 3/7 → GEO 43)                       |
| Crawl assets                                    | robots, sitemap (22), lms.txt, 404, _redirects |

**Structured data in raw HTML:** Organization, LocalBusiness, ProfessionalService, WebSite, Review/Rating (6 real), Service (9 pages), BreadcrumbList (21), FAQPage (11: home + faq + 9 solutions), HowTo (home), Person/author (about). All validated.

## What We've Done — SEO & GEO

### 1 · RENDERING & CRAWLABILITY (ROOT-CAUSE FIX)

- **Build-time prerendering of all 22 indexable routes** — real H1, body copy, and metadata now in served HTML (was an empty #root shell). Resilient fallback so a flaky route can't break the deploy.
- **hydrateRoot** entry so snapshots become interactive.
- **Graceful Supabase fallback** so a missing/misconfigured data layer no longer blanks static pages or the prerender.

### 2 · METADATA (PER-ROUTE)

- **usePageMeta** hook: unique title, description, canonical, OG/Twitter on every route (previously all routes shared one static head).
- Shortened the 83-char homepage title; trimmed all over-length titles/descriptions.

### 3 · STRUCTURED DATA

- Added **WebSite**, **FAQPage** (home + /faq + all 9 solutions), **Service** (9), **BreadcrumbList** (inner pages), **HowTo** (process), **Person/author** (Tyler Welsh), **Review** (6 real testimonials).
- Kept existing Organization / LocalBusiness / ProfessionalService.
- Fixed a schema-parity bug (home FAQ schema leaking to all pages) and a prerender bug (home snapshot becoming the template for every route).

### 4 · ON-PAGE GEO CONTENT

- **"What is Disruptors Media?"** liftable definition on home + about.
- **Answer-first "What is {service}?"** framing on all 9 solutions pages.
- Real **<ol> numbered process, <blockquote>/<cite> attributable testimonials**, single-H1 + ordered H2/H3 hierarchy.
- **FAQ** page + home section + per-service FAQs surfaced; **lms.txt** for AI crawlers.

### 5 · ACCESSIBILITY (LIGHTHOUSE 100)

- Icon-button aria-labels, WCAG AA contrast fixes (gold), 44px touch targets, explicit image dimensions.

### 6 · PERFORMANCE & UX

- Mobile-gated + lazy-loaded heavy background videos; deferred the billboard popup off the LCP path.
- Supabase image transform URLs (resize + auto-WebP) on logos/marquee/service cards; width/height set.
- Removed the 1.7s fake loading-screen splash; fixed the services carousel jitter/slow-load.
- Fixed a service worker that was serving a stale cached shell (would have pinned visitors to the old site).

### 7 · CRAWL INFRASTRUCTURE

- Sitemap synced to the 22 prerendered routes; robots.txt allows all AI crawlers; legacy 301 redirect scaffold + branded 404.html for link-equity recovery.

## What Could Still Be Done

## CODE CAN DO NOW

- **JS code-split the 1.8 MB entry chunk** (~1.3 MB unused on marketing pages) — biggest remaining Performance / Total-Blocking-Time lever. Needs careful, tested work.
- **AggregateRating** on Organization — once a real Google review count is provided (left out to avoid fabricating numbers).
- **Article schema** on blog posts; **speakable** schema for voice surfaces.
- **Scope the presentation service worker** to the presentation feature only (it currently caches aggressively for every visitor).
- **Drop / "hidden" source maps** from the deploy (18 MB) once debugging isn't needed.

## CONTENT NEEDS HUMAN ATTENTION

- **Approve / expand the FAQ copy** (Q2–Q6 are drafts) — more approved Q&As = more GEO surface.
- **Per-service definitions** (one clean "X is Y" sentence each) to strengthen answer-first blocks.
- **Non-branded keyword content** (the gap behind only 16 organic keywords) — service / location landing pages.

## INFRA & DEPLOY NEEDS HUMAN ATTENTION — UNLOCKS EVERYTHING

- **Deploy camillo** with the prerender wired into the Netlify build (npm run build:prerender + npx playwright install chromium). Nothing above counts until this ships and bots re-crawl.
- **Re-encode the Supabase videos** (12 MB → <2 MB) + poster frames — the single biggest payload win.
- **Convert fonts to WOFF2** (self-hosted .otf → ~50–70% smaller).
- **Populate the legacy 301 map** from the Backlink Audit (recovers equity from 469 referring domains).

## VERIFICATION POST-DEPLOY

- Google Rich Results Test (Organization + FAQPage + Review + Breadcrumb + HowTo).
- PageSpeed Insights on the live dev URL — the only accurate Performance number (local is distorted by no compression/CDN).
- Re-run the Content Agent GEO diagnostic + re-test "what is Disruptors Media" in AI engines after re-crawl → goal **Cited = yes**.

**Bottom line.** On-page SEO and GEO are now comprehensive and verified in the raw HTML — 22/22 routes prerendered, full structured-data coverage, GEO signals 3/7 → 7/7, Accessibility and SEO at 100. The remaining gains are mostly **deployment and off-page**: ship the branch with prerendering in CI, re-encode the videos, and populate the legacy redirect map. Those unlock the real, measurable score improvements.
